

## **2016-16:**

# **Underwater Energy Harvesting**

This call is for the development of underwater energy harvesters for underwater sensors and potentially underwater vehicles. The form fit of the system should be compact and easy to install or integrate with underwater nodes and vehicles. However, we are prepared to consider larger system if the technologies could provide significant yield compared with conventional battery designs.

Technologies that yield incremental enhancement of conventional battery designs, wave-glider designs will not be considered.
